Bureau of Management Services in the Governor's Office of Budget and Administration

ESTIMATES OF THE JULY 1978
TOTAL AND HOUSEHOLD POPULATION
FOR COUNTIES BY
AGE, SEX, AND RACE

November 1979

The preparation of this document was financed in part through a Comprehensive Planning Grant from the Department of Housing and Urban Development, under the provisions of Section 701 of the Housing Act of 1964, as amended.

Bureau of Management Services
Governor's Office of Budget and Administration

The work related to population estimates and projections has been transferred from the Office of Policy and Planning (formerly the Office of State Planning and Development) to the Bureau of Management Services in the Governor's Office of Budget and Administration. The estimates of county population by age, sex, and race in this report were prepared by Nathalie G. Sato with the programming assistance of Joann Bobincheck. Typing was done by Grace Harper.

CHARACTERISTICS OF THE JULY 1978 POPULATION

In this annual report of county population characteristics by age, sex, and race a new element was added for the estimates of population in households. The estimate was made after the population in institutions and group quarters was updated. By taking this approach the age estimates for counties with a large institutional population have been improved. The sum of the two populations is total population.

The estimate of total county population was prepared jointly by the Office of State Planning and Development (now the Office of Policy and Planning) and the U.S. Bureau of the Census. Estimates of state population by selected age groups were prepared by the U.S. Bureau of the Census. All other estimates were prepared by the Office of State Planning and Development and controlled to the county totals and state age groups.

By July 1978, Pennsylvania's total population had dropped to 11,750,000 or 51,000 less than the 1970 census count of 11,800,766. Between 1970 and 1978 there were 1,015,600 deaths and 1,319,000 births. In comparison with the previous decade, the number of deaths during the Seventies will approximate the number which occurred during the Sixties. The number of births in the Seventies dropped significantly. During the Sixties there was a total of 2,207,200 births, but if the most recent six-year average of 152,000 annual births continues, total births during the Seventies may not exceed 1,600,000, or 500,000 fewer births than occurred during the Sixties. During the Sixties, the crude birth rate was 18 per thousand, but in the eight years of the Seventies, the rate had dropped to 11 per thousand.

With the exception of 1971, Pennsylvania has experienced a net out-migration of population during the Seventies. The 1970-71 net in-migration included servicemen returning from Vietnam. In succeeding years net out-migration ranged between 10,000 and 86,000 per year. The lowest net out-migration occurred during 1975 when the Vietnamese refugees were located temporarily in Pennsylvania. In the following year, there was a dramatic out-migration of 86,000. The accumulated eight year total of 354,000 net out-migrants approaches the 1960-70 number of 375,000 net out-migrants. In both time periods the rate of out-migration was approximately three percent.

The central counties of Pennsylvania's largest SMSAs continued to show the largest population losses and out-migration. In the eight year period, Philadelphia lost 189,700, while Allegheny county lost 128,200. Delaware County, part of the Philadelphia SMSA lost 29,600 people. Other losses occurred in the old coal mining counties of Luzerne (4,100), Lackawanna (2,200), and Schuylkill (2,800). Cambria's population loss of 1,700 reflects the Johnstown flood of 1977 and the closing of a steel plant. There were also population losses of 2,000 or less in the counties of Blair, Dauphin, Elk, Lawrence, Mercer, Mifflin, McKean, and Warren.

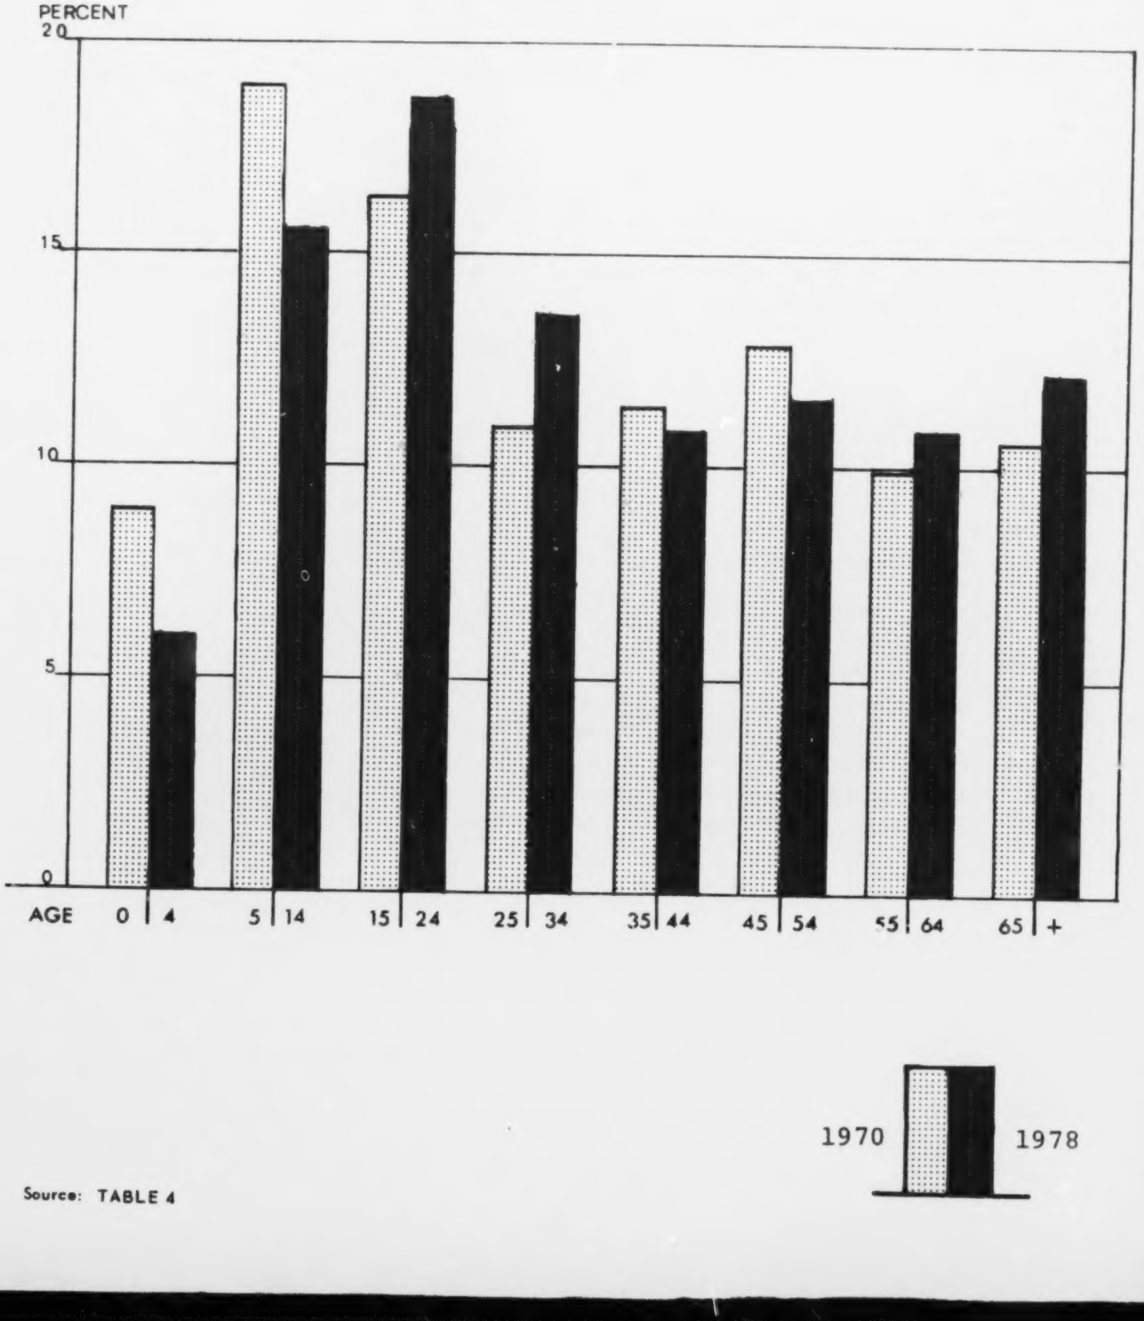
While the central counties of the Philadelphia SMSA suffered a loss of population, the suburban counties of Bucks and Chester gained 55,100 and 25,100 respectively. In the Harrisburg SMSA Dauphin lost 1,500 while Cumberland gained 15,700 and Perry grew by 5,100. The suburban counties of the Pittsburgh SMSA remained close to the 1970 population levels. The metropolitan areas of Allentown-Bethlehem, Lancaster, and York had notable growth rates between 1970 and 1978. In the counties of Butler, Centre, Indiana, and Monroe the population growth ranged between 8,000 to 15,000 while the rate of growth exceeded 10 percent. Rates of growth exceeding 10 percent were also experienced by the five small counties of Fulton, Juniata, Pike, Wyoming, and Wayne. With the exception of Wayne, these counties had 1970 populations of less than 20,000.

In the eight years which have elapsed since the 1970 census, Pennsylvanians have become older. There was an increase of 622,000 in the number of persons over 18 years of age, and there are 195,000 more persons over 65 years of age. At the other end of the age scale there are 639,000 fewer people under 15 years of age (see figure 1).

The 1970 institutional and group quarters population was redefined and estimated to have been 243,500, while the population in households and rooming houses was estimated to have been 11,557,200 in 1970. In the eight years since 1970 there was a gain of 5,000 in the institutional population, while there was a loss of 55,000 in the household population. Much of the gain in the institutional and group quarter population occurred in the colleges and universities. It was estimated that college dormitory residents increased in the same manner as college enrollments. There was also an increase in the number of nursing home residents, while the penal population increased by ten percent. The number of people in institutions for the mental health and mental retardation was halved.

Figure 1

DISTRIBUTION OF STATE POPULATION BY SELECTED AGE COHORTS IN 1970 – 1978



Source: TABLE 4

While the total population in households did not change significantly between 1970 and 1978, the number of households increased by 425,000. In 1978 there were 4,130,000 households with an average size of 2.8 persons. The decline in the average household size from 3.1 persons in 1970 is attributable to the large increase in the number of single individuals living alone (see table below).

It is also estimated that there was a small increase in the number of families. While there was a 15 percent increase in small families of two and three members, the number of large families of 5 or more persons declined. Average family size dropped from 3.6 persons in 1970 to 3.3 in 1978. The following table presents estimates of the number of households by size and their population in Pennsylvania.

Number of Households in Pennsylvania by Size
(in thousands)

Type	Number		Population	
	1970	1978	1970	1978
Total	3,705	4,130	11,557	11,501
Families	3,011	3,219	10,785	10,590
2 member	1,057	1,266	2,114	2,532
3 member	648	709	1,943	2,127
4 member	572	651	2,286	2,604
5 member	365	345	1,824	1,725
6+ member	369	248	2,618	1,602
Primary Individuals	694	911	772*	911

*Population includes such persons as guests or servants living with the primary individual.

Sources: 1970 Census of Population, OSPD estimates, and the assumption that Pennsylvania's similarity to the national distribution of household sizes in 1970 persisted into 1978. The 1978 national distribution of household by size is published in the Bureau of Census, "Household and Family Characteristics: March 1978," Current Population Reports, Series P-20, No. 340.

ESTIMATES PROCEDURES

While the methods used to estimate the age, sex, and race characteristics of the 1978 county population are similar to those developed to estimate the 1977 characteristics, one significant improvement was added. The 1978 estimates incorporate an estimate of the populations in households and in selected institutions and group quarters. The separate estimates of the household and institutional populations were summed and controlled to the provisional 1978 estimates of total county population and the U.S. Bureau of the Census estimates of state population by selected age groups. 1/

The total 1978 county population estimates were prepared by the Office of State Planning and Development (now Office of Policy and Planning) in accordance with methods developed by the Federal-State Cooperative Program for Local Population Estimates. These methods are well documented in the Bureau of Census, Current Population Reports, Series P-26. 2/

As stated above, the estimates of the population characteristics were split into two estimates of the institutional and household populations. The institutional population was estimated first.

Institutional population. The estimate of the 1978 institutional population was based on the 1970 county institutional population by type, age, sex, and race, and indices of change in the institutional population. The institutional populations, which the U.S. Bureau of the Census identified in 1970, were inmates and residents of mental hospitals, homes for the aged, other institutions (correctional, juvenile, mental retardation), military barracks, college dormitories, rooming houses, and miscellaneous group quarters. The 1970 age-sex-race characteristics of these residents by type of institution was estimated from the state distribution and controlled to county totals for type of institution and the county age distribution of the nonhousehold population.

Because rooming houses and miscellaneous group quarters were small and difficult to inventory after 1970, the population in these places was combined with the 1970 household population. Mental hospitals were combined with other institutions to overcome differences in the definition of institutions for mental health and retardation made by the U.S. Bureau of the Census and the State Department of Public Welfare.

As part of the annual county population estimates program, data on the institutional populations had been collected. The fall enrollments of colleges and universities with dormitories, the average annual inmate population of mental and penal institutions, and an annual survey of residents in military barracks had already been obtained and used in the estimate of total county population. The Health Department's 1977 survey of long term care facilities and tabulation of patients was used to update the estimated number of persons in homes for the aged.

While the number of residents in each and every institution was not obtained, the 1970-78 county rate of change for the major institutions by type could be computed and applied to the 1970 institutional population. In doing this, it was assumed that the 1978 institutional population would have the same age-sex-race distribution as the 1970 population by type of institution. Typically the dormitory resident is between the ages of 18 and 21, while the nursing home patient is advanced in years. Some known changes, such as the increased proportion of coed college students, and the removal of juveniles from the Camp Hill Correctional Institution after 1970 were ignored for the sake of expediency.

Household population. The 1970 county population by age, sex, and race in households was adjusted for post censual corrections and for additions of persons living in rooming houses and miscellaneous group quarters. The 1970 household population surviving to 1978 was obtained by aging the population eight years, subtracting deaths by age in each year between April 1970 and July 1978, and by adding births. In making this estimate of the surviving population, it was assumed that all births and deaths occurred within the household population. This assumption follows the Health Department's practice of assigning residence to a person's home rather than to the institution in which the person actually lived. For example, the Health Department codes Cumberland County as the place of residence for the Penn State student from Cumberland, killed in motor vehicle accident in Mifflin County. Census counts and estimates assign the student's residence to Centre County.

The assumption that all births and deaths occur in household population is also logical, if it is assumed that the institutional population is static in its age, sex, and race characteristics. Change in the institutional population occurs as a person enters or leaves the institution. The corollary assumption that only the household population migrates is made.

The total number of migrants is the difference between the surviving population and the total 1978 population less the 1978 institutional population. To make the additional estimate of migrants by race it is necessary to establish county control totals. The control totals were based on the estimated total county household population and racial totals derived from the vital rates method. In this method, county birth and death rates were compared to the state rate in 1970. It was then assumed that the county will have the same relative rate to the state in 1978. For counties with a sizeable nonwhite population, this method produces reasonable estimates, but where the nonwhite population is small, there is considerable variation in the number of births and deaths which is not explained by a change in the total population.

The disaggregation of migrants by age, sex, and race was based on the migrant characteristics tabulated from the 1970 census of population. Age-sex-race distributions of migrants to and from each county were derived from two Bureau of Census reports on gross migration between 1965 and 1970. 3/ The appropriate distribution by direction of movement was applied to the estimated total migrants. Migrants by age, sex, and race were added algebraically to the surviving population.

The number of households by county was based on the population in households, and the assumption that the average household size changed in the same way as the U.S. average household size changed. In 1970 the U.S. average household size was 3.14 persons, but by 1978 it was estimated that the average size was 2.81. 4/ The 1970 county average household size was scaled down relative to the U.S. average and divided into the 1978 estimated household population. The initial estimate of the number of county households was then controlled to the Bureau of the Census estimate of 4,130,000 households in Pennsylvania, 5/ and the county average household was recomputed.

JULY 1980

Bureau of Management Services
Governor's Office of Budget and Administration

Characteristics of the July 1979 Estimate Population

While the 1979 estimates of county population were under preparation, the 1980 Census was taken. The Census is a count of each and every person by place at a particular point in time. An estimate is based on a previous census count, tabulations of births and deaths, and symptomatic indices of migration. One method of estimating migrants is based on the difference between the expected and actual school enrollments. By extension migration in the total population is based on migration of the school age population. Another index of migration is based on matching federal income tax returns from year to year. When an individual tax return is filed from a second county in the following year, migration is said to have occurred.

Estimates can be verified by a census count, but census counts are expensive. From previous tests, on the estimating methods made after the 1970 Census, the average deviation of the estimate from the census count was less than three percent for counties with a population of 100,000 or more. For counties ranging in size from 10,000 to 99,999 the difference was between 4.0 to 4.7 percent. Estimates for counties under 10,000 had an average error as high as five or seven percent.

The estimates of the total 1979 county population were prepared by the Bureau of Management Services in the Governor's Office of Budget and Administration in cooperation with the U. S. Bureau of the Census. Estimates of the total state population by selected age groups were prepared by the U. S. Bureau of the Census. All other estimates were prepared by the Bureau of Management Services and controlled to the county totals and selected state age groups.

In 1970 Pennsylvania had a population of 11,800,766. On the eve of the 1980 census, the Bureau of the Census estimated that Pennsylvania had a July, 1979 population of 11,731,000 or 70,000 less than its 1970 population. Between 1970 and 1979 there were 1,133,200 deaths and 1,469,700 births. Net migrants is estimated to be -406,600. While the decade total of births, deaths and migrants are not in, the nine year total may be compared with the previous decade. The number of deaths in the Sixties and in the Seventies will be approximately the same. Births during the Sixties totaled 2,207,200, but it is unlikely that births in the Seventies will exceed 1,600,000. The number of net out-migrants during the Seventies exceeds the 375,000 net out-migrants between 1960 and 1970, but is less than the 475,000 net out-migrants between 1950 and 1960.

The central counties of Pennsylvania's largest SMSAs continued to show the largest population losses and out-migration. In the nine year period, Philadelphia lost 200,800 while Allegheny County lost 147,000. Delaware County, part of the Philadelphia

SMSA lost 33,800 people. In the Northeast SMSA, Luzerne and Lackawanna lost 3,400 and 4,400 respectively. Cambria's loss of 2,800 can be ascribed to the Johnstown flood and the closing of a steel mill.

The Philadelphia SMSA suburban counties of Bucks and Chester gained 59,700 and 27,200 respectively. The Lancaster and York SMSAs grew by 33,800 and 29,300 at rates of 11 and 9 percent. The population in the three suburban counties of Pittsburgh remained close to the 1970 levels. A small increase in Westmoreland County reflects the opening of the VW assembly plant.

The Pocono counties of Monroe, Pike, and Wayne continued to have the highest growth rates in the state. Wyoming's growth rate and location places this county in the Poconos, but its growth is dependent on manufacturing rather than tourism and second home development. In addition, Butler, Indiana, Jefferson and Union had growth rates of ten or more percent.

In the nine years which have elapsed since the 1970 Census, Pennsylvanians have grown older. In 1970, 3,181,000 persons or 27 percent of the total population were under 15 years of age. By 1979, this group shrank to 2,475,000 or 21 percent of the total. At the other end of the age scale, there were 1,267,000 persons 65 years or more in 1970. By 1979, there were 1,493,000 persons 65 and over, and the proportion had increased from 11 to 13 percent. The number of young adults between the ages of 15 and 34 increased from 3,248,000 to 3,825,000 or approximately one third of the total population. See Figure 1, Distribution of State Population by Selected Age Groups.

In 1970, institutional and group quarter population was redefined and estimated to have been 244,000, while the population in households and rooming houses was estimated to have been 11,557,200 in 1970. In the nine years since 1970 there was a gain of 5,000 in the institutional populations while there was a loss of 75,000 in the household population. Much of the gain in the institutional and group quarters population occurred in old age homes and college dormitories. Both gains are a reflection of the demographic changes which occurred during the decade: increases in the elderly population, and the large college enrollments during much of the decade. The number of people in institutions for mental health and mental retardation was halved, while there was a significant increase in the penal populations. The latter changes are due in part to changes in public policy.

In 1970 there were 3,705,410 households. By 1979 it was estimated that the number of households increased to 4,165,000. The average size of the households dropped from 3.1 in 1970 to an estimated 2.8 in 1979. Much of this change is due to the significant increase in the number of single person households.

The racial estimates are based on a vital rates method. Statewide the white/nonwhite composition of Pennsylvania is much the same in 1979 as in 1970. There are indications that both groups may be found in the net out-migrants leaving the state. Migration of the nonwhite population from the central city of the major SMSAs to the suburban counties has occurred during the Seventies.

Estimating Procedures

The total 1979 county population estimates were prepared by the Bureau of Management Services, Office of Budget and Administration in accordance with methods developed by the Federal-State Cooperative Program for Local Population Estimates. These methods are well documented in the Bureau of Census, Current Population Reports, Series P-26.[1]

The estimates of the county population characteristics were split into two estimates of the institutional and household populations. The institutional population was estimated first.

Institutional Population. The estimate of the 1979 institutional population was based on the 1970 county institutional population by type, age, sex, and race, and indices of change in the institutional population. The institutional populations, which the U. S. Bureau of the Census identified in 1970, were inmates and residents of mental hospitals, homes for the aged, other institutions (correctional, juvenile, mental retardation), military barracks, college dormitories, rooming houses, and miscellaneous group quarters. The 1970 age-sex-race characteristics of these residents by type of institution was estimated from the state distribution and controlled to county totals for type of institution and the county age distribution of the nonhousehold population.

Because rooming houses and miscellaneous group quarters were small and difficult to inventory after 1970, the population in these places was combined with the 1970 household population. Mental hospitals were combined with other institutions to overcome differences in the definition of institutions for mental health and retardation made by the U. S. Bureau of the Census and the State Department of Public Welfare.

As part of the annual county population estimates program, data on the institutional populations had been collected. The fall enrollments of colleges and universities with dormitories, the average annual inmate population of mental and penal institutions, and an annual survey of residents in military barracks had already been obtained and used in the estimate of total county population. The Health Department's 1978 survey of long term care facilities and tabulation of patients was used to update the estimated number of persons in homes for the aged.

While the number of residents in each and every institution was not obtained, the 1970-79 county rate of change for the major institutions by type could be computed and applied to the 1970 institutional population. In doing this, it was assumed that the 1979 institutional population would have the same age-sex-race distribution as the 1970 population by type of institution. Typically, the dormitory resident is between the ages of 18 and 21, while the nursing home patient is advanced in years. Some known changes, such as the increased proportion of coed college students, and the removal of juveniles from the Camp Hill Correctional Institution after 1970 were ignored for the sake of expediency.

Household Population. The 1970 county population by age, sex, and race in households was adjusted for post censual corrections and for additions of persons living in rooming houses and miscellaneous group quarters. Thus, in this report, population in households differs from the usual definition of families and individuals maintaining a household. The 1970 household population surviving to 1979 was obtained by aging the population nine years, subtracting deaths by age in each year between April, 1970 and July, 1979, and then adding births. In making this estimate of the surviving population, it was assumed that all births and deaths occurred within the household population. This assumption follows the Health Department's practice of assigning residence to a person's home rather than to the institution in which the person actually lived. For example, the Health Department codes Cumberland County as the place of residence for the Penn State student from Cumberland, killed in motor vehicle accident in Mifflin County. Census counts and estimates assign the student's residence to Centre County.

The assumption that all births and deaths occur in household population is also logical, if it is assumed that the institutional population is static in its age, sex, and race characteristics. Change in the institutional population occurs as a person enters or leaves the institution. The corollary assumption is made that only the household population migrates.

The estimate of county household population by race is based on the vital rates method and an independent estimate of state population by race. In the vital rates method, county birth and death rates by race are compared to the state rates in 1970. It is then assumed that the county will have the same relative rate to the state in 1979. The 1979 state vital rates and the county relatives can then be used to estimate county population by race. For counties with a sizeable nonwhite population, this method produces reasonable estimates, but where the nonwhite population is small, there is a considerable variation in the number of births and deaths which is not explained by a change in the population.

The total number of migrants is the difference between the surviving population and the total 1979 population less the 1979 institutional population. The disaggregation of migrants by age, sex, and race was based on the migrant characteristics tabulated from the 1970 census of population. Age-sex-race distributions of migrants to and from each county were derived from two Bureau of the Census reports on gross migration between 1965 and 1970. [2] The appropriate distribution by direction of movement was applied to the estimated total migrants. Migrants by age, sex, and race were added algebraically to the surviving population.

The U. S. Bureau of the Census has made post census estimates on the number of households by state, but no estimates were prepared for 1979. Because of this, the method for estimating the number households by county was modified. The estimates presented in this report are based on the average number of tax exemptions claimed on federal income tax returns by county for the years 1969, 1972, and 1974 through 1977. It was assumed that the average household size changed in the same way as the average number of tax exemptions. The trend in tax exemptions was extrapolated to 1978 and 1979. A ratio between household size and tax exemptions was used to estimate the 1978 and 1979 average household size for the state and 67 counties.

The number of households in Pennsylvania for 1979 was obtained by dividing the household population by the extrapolated household size. This initial estimate was adjusted to be in line with the Bureau of the Census 1978 state estimate of households in 1978. The number of households by county were controlled to the state total.

---

1. The last published report for Pennsylvania appears in P-25, No. 794 (March, 1979). A similar report will not be published for 1979.
